# **Bimloq**

**Business Models Optimization for Quality (BIMLOQ)** 

• MNiSW Research Grant no. N516 422338

• Project Leader: prof. dr hab. inż. Antoni Ligęza

• Project Coordinator: dr hab. inż. Grzegorz J. Nalepa

• Timeline: 2010-05→2012-12

• Duration: 32 months

# **Motivation**

The main aim of Business Models Optimization for Quality (BIMLOQ) is to build a declarative model for business processes, including business rules specification, with an emphasis on analysis and optimization of those processes.

- **Semantic:** lack of a common ontology, lack of unified semantics, difficult unambiguous logical representation.
- **Functional:** aims and tasks in the business logic layer cannot be mapped to logical quality assessment methods.
- **Technical:** technologies used in the visual design layer are incompatible with the declarative logical representation.

# Intended results

- Conceptual: declarative model for logical business process representation and analysis.
- Practical:
  - new tools for analysis and optimisation of specification quality,
  - integration of visual BPMN tools and logical knowledge processing.
- **Evaluative:** modeling and analysis of real-life application use cases.

### **Expected benefits:**

- Real-time quality assessment during development.
- Maintainability assurance.
- Formal analysis of business software quality.
- High adaptability in dynamic environments.

#### 0.3 Loki

### **Description**

**Loki** is a semantic wiki that uses strong logic-based knowledge representation. It implements semantic annotation mechanism as well as enable intelligent aggregation and querying. It serves as a flexible platform for collaborative knowledge engineering.

### **Papers**

- TCCI III LNCS paper: Loki Semantic Wiki with Logical Knowledge Representation (2011,

#### 0.4 HeaRT in Wiki

### 0.5 Pellet-HeaRT

#### **Description**

**PelletHeaRT** is a prototype of a hybrid rule reasoner for ontologies. It assumes an integration of classic forward chaining rule reasoning implemented by HeaRT with the Pellet resoner. The project and implementation is based on a proposal of integrating *Attribute Logic with Set Values over Finite Domains (ALSV(FD))* and *Description Logics (DL)*.
